

Car Wax Preserves Paint Jobs

Do you feel that your paint job looks duller than it should? Perhaps you just purchased a new car and would like to protect the exterior paint. If either of these statements pertain to you, then you should be in the market to purchase car wax.

Before you buy some and get started, there are a few things you may want to know about car wax. There are many good brands of wax to choose from, but your best bet is buying a kind that contains carnauba wax. Carnauba wax is better at keeping out moisture and it is easier to buff than typical car wax, and therefore it is a bit more costly.

It is best to bypass granular or abrasive waxes unless you are a professional. Granular car waxes can cause damage to your paint if not used on the correct colors and finishes. If you are in doubt, go with smooth car wax.

A good car wax typically shows stiffness and is difficult to wax on and off the car. If you feel your arms getting tired, that usually means you have some quality car wax on your hands! Soft waxes are easier to put on and remove, but they usually do not protect as well.

Spray on and rub on waxes are two sorts which are widely available. If you have arthritis or generally sensitive hands, spray on car wax may be right for you. Since these kinds of waxes are softer, however, you will have to apply them more frequently for maximum results. Car waxes which come in round tubs are harder to apply and remove, but you do not have to apply them as often and the paint protection is typically better.

Since you know which car wax to pick for your needs, we can get to the waxing process. First, you will need to wash your car well, making sure that you dry it completely afterward. Next, park your car in the shade or in a cool spot. Picking a cool day is optimal so that the wax does not dry too quickly for you to remove it effectively.

A damp sponge, and a soft terry cloth rag are all you will need for waxing. Dip your dampened sponge into the wax, keeping a dollop the size of a half dollar coin on there.

Beginning on one side of the car, rub on the car wax with small circular motions. If you start on one side, work all the way around your car using the same motions, reapplying wax to the sponge when needed. Be careful to avoid cracks between the doors, hood and trunk. If you get some wax in these seams, you can use a soft bristle toothbrush to gently remove it.

Once you have worked your way completely around the car, the wax will be dry where you started and you can begin removing it. Remove wax with the terry cloth towel from where you began, using the same motions. Once you are finished, look for any spots you missed. Remember to get all of the car wax off within a couple of hours at most, because it can damage your paint job if left on. See More [Car washing supplies](#) . " title="Car washing">Car wash .
